The lecture will be started at 5:05PM sharply!

COMP5046
Natural Language Processing

Lecture 7: Dependency Parsing

Dr. Caren Han

Semester 1, 2022
School of Computer Science,
University of Sydney

0 The course topics

THE UNIVERSITY OF SYDNEY

What will you learn in this course?

- Week 1: Introduction to Natural Language Processing (NLP)
- Week 2: Word Embeddings (Word Vector for Meaning)
- Week 3: Word Classification with Machine Learning I
- Week 4: Word Classification with Machine Learning II

NLP and Machine Learning

- Week 5: Language Fundamental
- Week 6: Part of Speech Tagging
- **Week 7: Dependency Parsing**
- Week 8: Language Model and Natural Language Generation

NLP Techniques

- Week 9: Information Extraction: Named Entity Recognition
- Week 10: Advanced NLP: Attention and Reading Comprehension
- Week 11: Advanced NLP: Transformer and Machine Translation
- Week 12: Advanced NLP: Pretrained Model in NLP

Advanced Topic

- Week 13: Future of NLP and Exam Review

0 LECTURE PLAN

THE UNIVERSITY OF SYDNEY

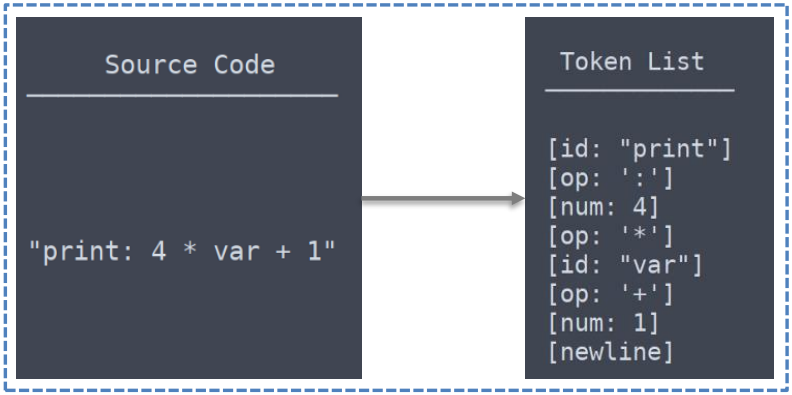
Lecture 7: Parsing

1. **Linguistic Structure**
2. Dependency Structure
3. Dependency Parsing Algorithms
4. Transition-based Dependency Parsing
5. Deep Learning-based Dependency Parsing

1 Linguistic Structure

Computer Language

tokenization of a function



Tokenisation

A token can be a variable or function name, an operator or a number.

Parsing Computer Language

Parsing

The parser turns a list of tokens into a tree of nodes – logical order

Can we apply this in a human (natural) language?

Parsing Natural Language (Human Language)

Q: Can we apply this in a human (natural) language?

A: Possible! But it is much more difficult than parsing computer language!

we don't naturally do this!

Why?

- *No **types** for words*
- *No **brackets** around phrases*
- *Ambiguity!*

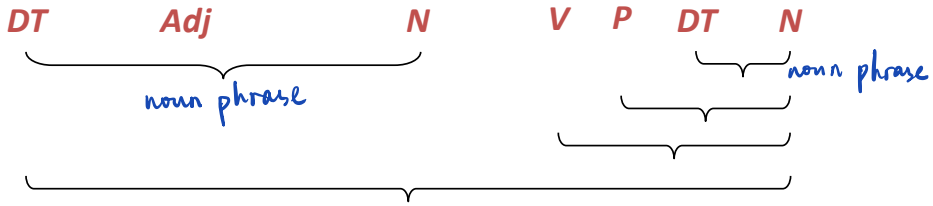
eg I love NLP — I: noun; love: verb

THE UNIVERSITY OF SYDNEY

Natural Language: Linguistic Structure

Let's try to categorise the given words (Part of Speech Tags)

The expensive computer is on the table

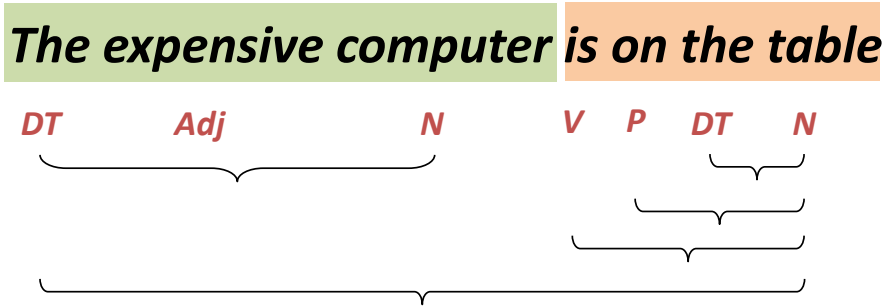


However, Language is **more than just a "bag of words".**
Grammatical rules apply to combine:

- words **into phrases**
- phrases into bigger phrases

Natural Language: Linguistic Structure

Let's try to categorise the given words (Part of Speech Tags)



consider DT Adj N as noun phrase noun block

However, Language is **more than just a "bag of words".**
Grammatical rules apply to combine:

- words **into phrases**
- phrases into bigger phrases

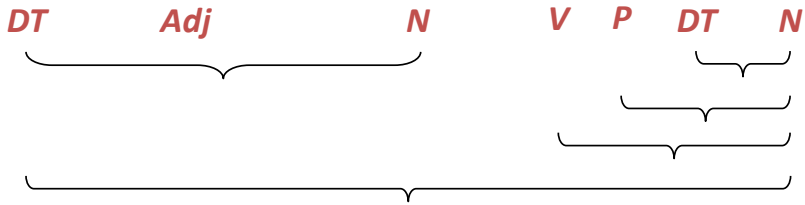
***Example**: a sentence includes **a subject** and **a predicate**.*
*The **subject** is noun phrase and the **predicate** is a verb phrases.*

Natural Language: Linguistic Structure

Phrase Structure Grammar = Context-free Grammar (CFG)

group word into phrase
different type of phrase will come with structure
not care about context of meaning

The expensive computer is on the table



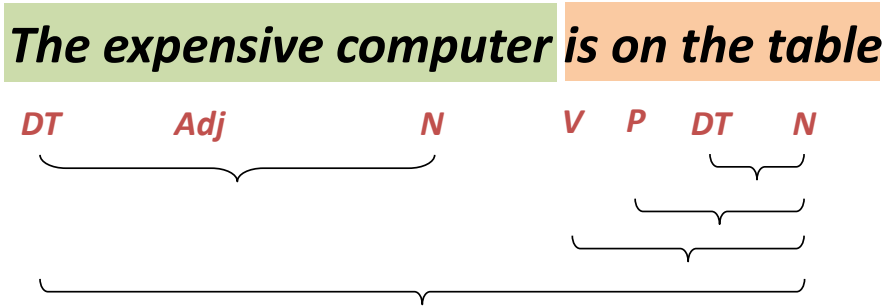
However, Language is **more than just a "bag of words".**
Grammatical rules apply to combine:

- words **into phrases**
- phrases into bigger phrases

***Example**: a sentence includes **a subject** and **a predicate**.*
*The **subject** is noun phrase and the **predicate** is a verb phrases.*

Natural Language: Linguistic Structure

Phrase Structure Grammar = Context-free Grammar (CFG)



However, Language is **more than just a "bag of words".**
Grammatical rules apply to combine:

- words **into phrases**
- phrases into bigger phrases

Parsing

- Associating tree structures to a sentence, given a grammar
  (Context Free Grammar or *Dependency Grammar*)
  will talk about this soon!

Parsing Natural Language (Human Language)

Q: Can we apply this in a human (natural) language?
A: Possible! But it is much more difficult than parsing computer language!

Why?

- *No **types** for words*
- *No **brackets** around phrases*
- ***Ambiguity!***

Syntactic Ambiguities

Grammars are declarative

- *They don't specify how the parse tree will be constructed*

Ambiguity

1. *Prepositional Phrase (PP) attachment ambiguity*
2. *Coordination Scope*
3. *Gaps*
4. *Particles or Prepositions*
5. *Gerund or adjective*

There are many more ambiguities…

THE UNIVERSITY OF SYDNEY

Syntactic Ambiguities – PP attachment Ambiguity

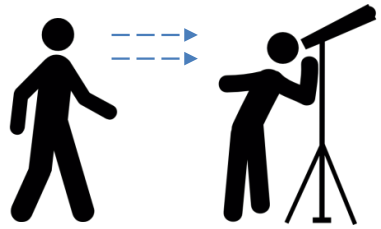
where is this part belonging to ?

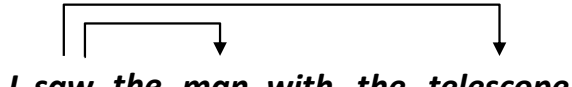
I saw the man with the telescope

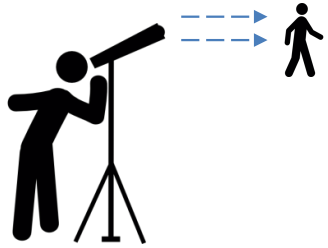
I - with the telescope

or

man - with the telescope



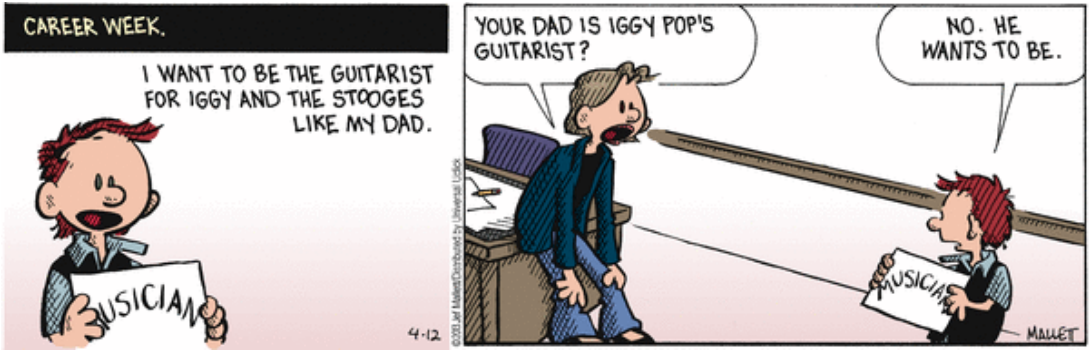




Syntactic Ambiguities – PP attachment Ambiguity Multiply

- A key parsing decision is how we 'attach' various constituents
  - *PPs, adverbial or participial phrases, infinitives, coordinations*

best solution ? check previous context



THE UNIVERSITY OF SYDNEY

Syntactic Ambiguities – Coordination Scope Ambiguity

I ate red apples and bananas

red apple only?

best solution?
① context
② common sense
domain knowledge

red apple & red bananas. ?

Syntactic Ambiguities - Gaps

subject – she ?
\ dog ?

She never saw a dog and did not smile

THE UNIVERSITY OF SYDNEY

Syntactic Ambiguities – Particles or Prepositions

- Some verbs are followed by adverb particles.
  (e.g. put on, take off, give away, bring up, call in)

She ran up a large bill

adverb particle

She ran up a large hill

Difference between an adverb particle and a preposition.

- *the particle is closely tied to its verb to form idiomatic expressions*
- *the preposition is closely tied to the noun or pronoun it modifies.*

Syntactic Ambiguities – Gerund or Adjective

Dancing shoes can provide nice experience

Gerund

Adjective

the shoe is dancing

When and Where do we use Parsing?

Syntactic Analysis *checks whether the generated tokens form a meaningful expression*

- *Humans communicate complex ideas by composing words together into bigger units to convey complex meanings*
- *We need to understand sentence structure in order to be able to interpret language correctly*

- *Grammar Checking*
- *Question Answering*
- *Machine Translation*
- *Information Extraction*
- *Text Classification*
- *Chatbot*

… and many others

1 Linguistic Structure

Two main views of linguistic structure

try to use phrase (context-free)

Constituency Grammar *(a.k.a context-free grammar, phrase structure grammar)*

- *Noam Chomsky (1928 -)*
- *Immediate constituent analysis*
- *Insists on classification and distribution*

syntactic

Dependency Grammar

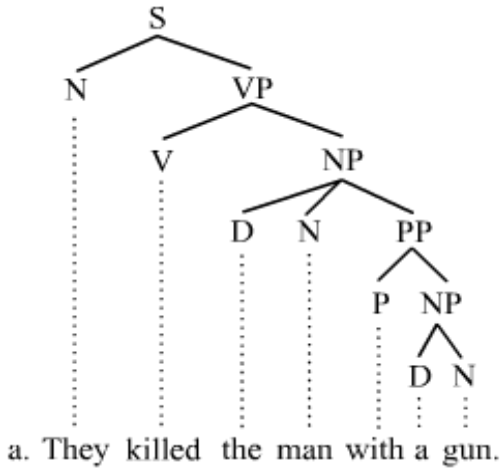
- *Lucien Tesniere (1893 – 1954)*
- *Functional dependency relations*
- *Emphasises the relations between syntactic units, thus adding meaningful links (semantics)*

semantic

1 Linguistic Structure

Two main views of linguistic structure

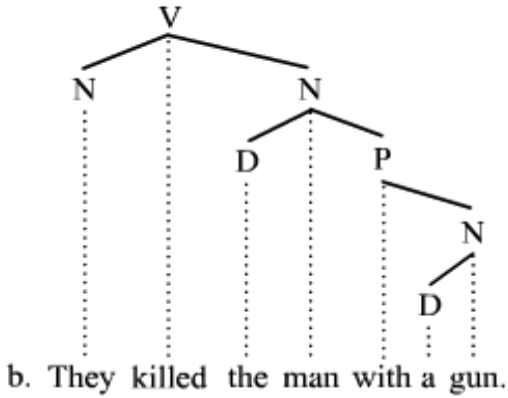
Constituency Parsing



Constituency grammars

One-to-one-or-more correspondence. For every word in a sentence, there is at least one node in the syntactic structure that corresponds to that word.

Dependency Parsing

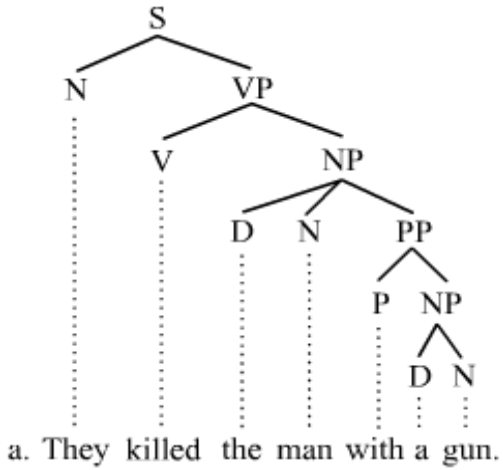


Dependency grammars

one-to-one relation; for every word in the sentence, there is exactly one node in the syntactic structure that corresponds to that word

Two main views of linguistic structure

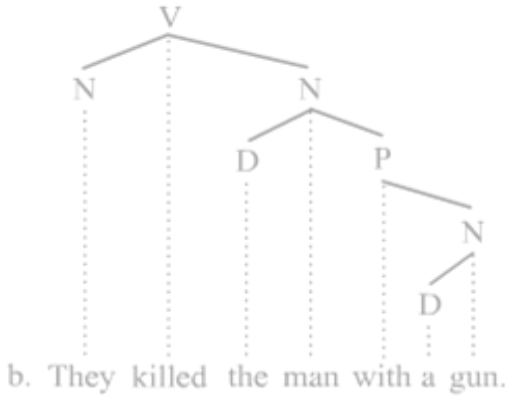
Constituency Parsing



Constituency grammars

One-to-one-or-more correspondence. For every word in a sentence, there is at least one node in the syntactic structure that corresponds to that word.

Dependency Parsing



Dependency grammars

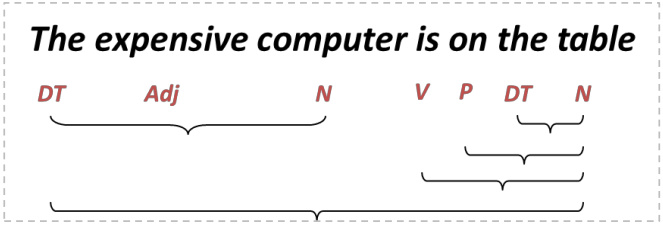
one-to-one relation; for every word in the sentence, there is exactly one node in the syntactic structure that corresponds to that word

Constituency Grammar

- *A **basic observation about syntactic structure** is that groups of words can act as single units*
- *Such groups of words are called **constituents***
- *Constituents tend to have **similar internal structure**, and behave similarity with respect to other units*

Examples

- *noun phrases (NP)*
  - *she, the house, Robin Hood and his merry men, etc.*
- *verb phrases (VP)*
  - *blushed, loves Mary, was told to sit down and be quiet, lived happily ever after*
- *prepositional phrases (PP)*
  - *on it, with the telescope, through the foggy dew, etc.*



THE UNIVERSITY OF SYDNEY

A sample context-free grammar

I prefer a morning flight

tokenize
D + pos tagging.

1. *Starting unit: words are **given a category (part-of-speech)***
2. *Combining words into **phrases with categories***
3. *Combining phrases into **bigger phrases** recursively*

A sample context-free grammar

1. *Starting unit: words are given a category (part-of-speech)*
2. *Combining words into phrases with categories*
3. *Combining phrases into bigger phrases recursively*

I, prefer, a, morning, flight

PRP VBP DT NN NN

A sample context-free grammar

I, prefer, a, morning, flight

PRP VBP DT NN NN

with category combine words together

rule based table

Grammar rule	Example
S → NPVP	I + want a morning flight
NP → Pronoun	I
NP → Proper-Noun	Sydney
NP → Det Nominal	a flight
Nominal → Nominal Noun	morning flight
Nominal → Noun	flights
VP → Verb	do
VP → Verb NP	want + a flight
VP → Verb NP PP	leave + Melbourne + in the morning
VP → Verb PP	leaving + on Thursday
PP → Preposition NP	from + Sydney

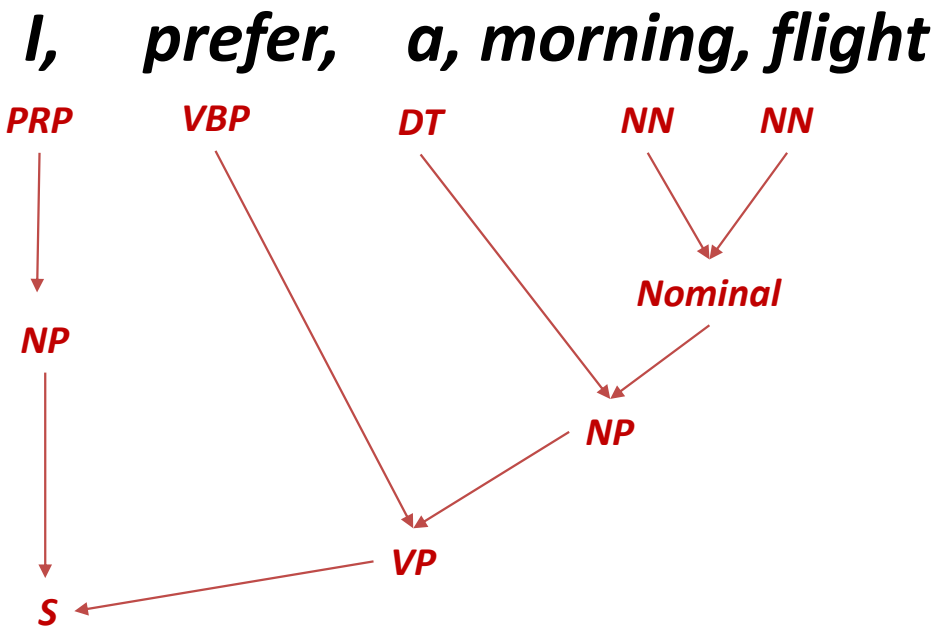
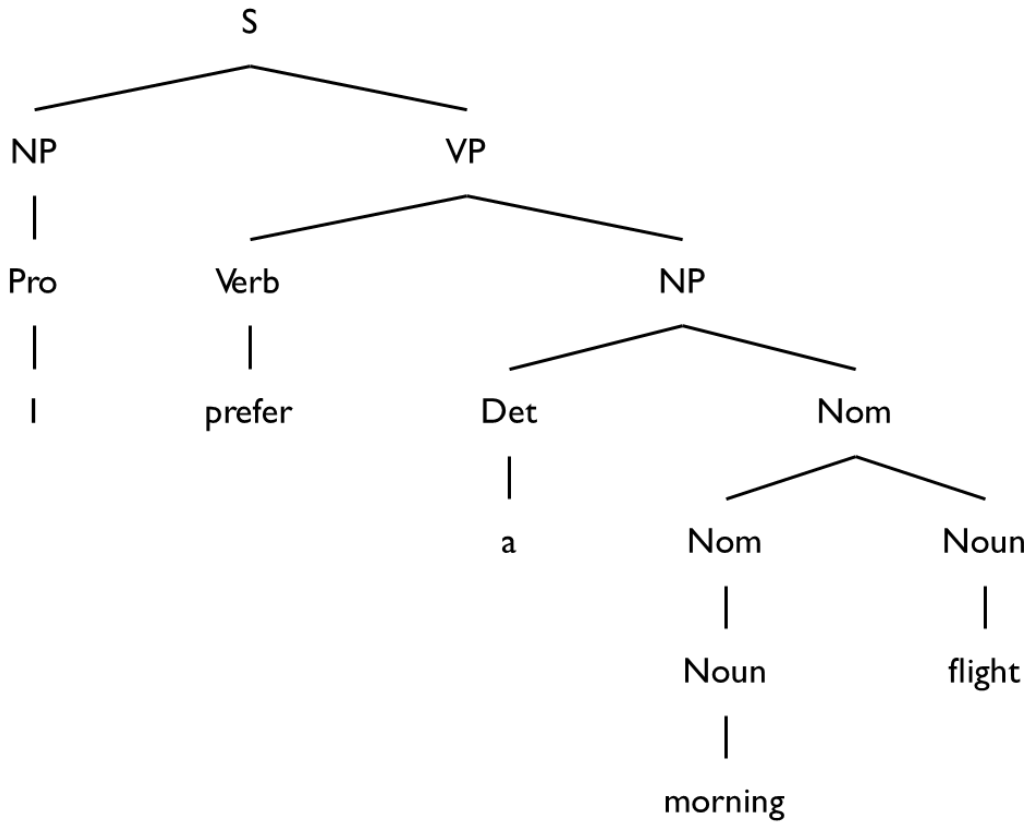
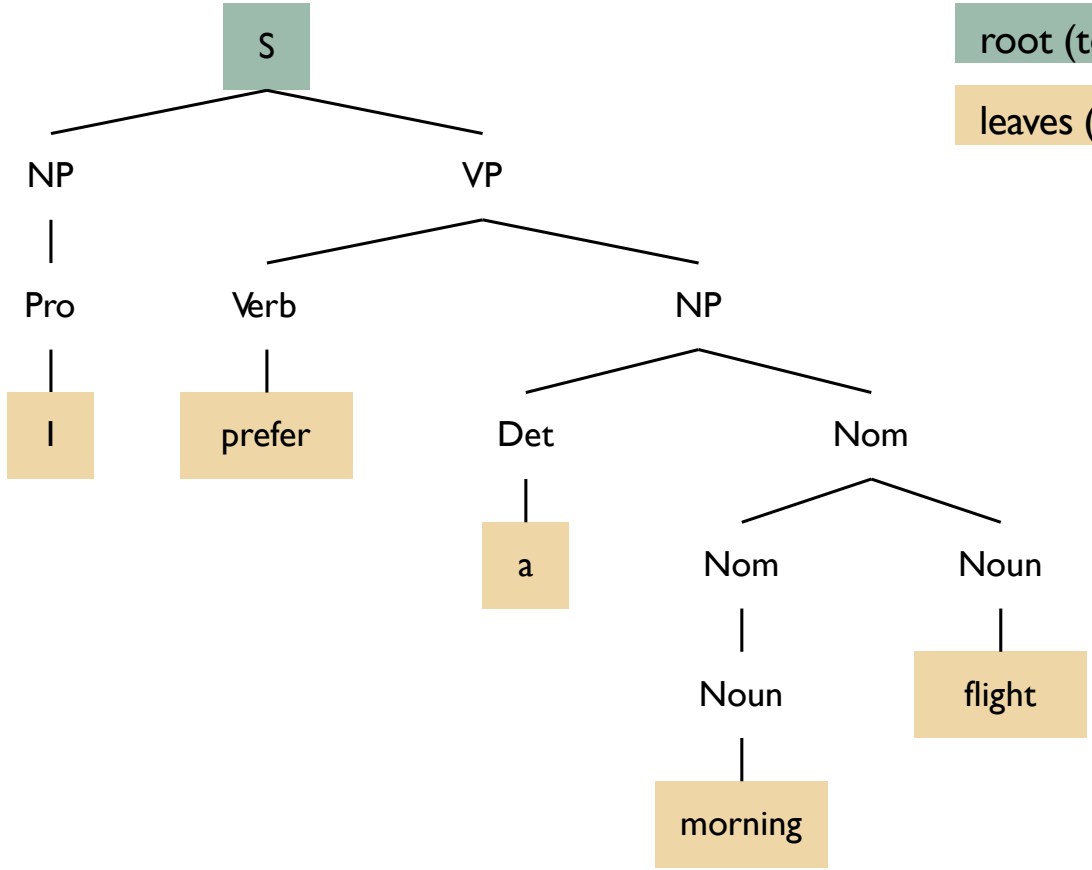
2. *Combining words into phrases with categories*
3. *Combining phrases into bigger phrases recursively*



A sample context-free grammar



A sample context-free grammar



Treebanks

Corpora where each sentence is annotated with a parse tree

- *Treebanks are generally created by*
  - *parsing texts with an existing parser*
  - *having human annotators correct the result*
- *This requires detailed annotation guidelines for annotating different grammatical constructions*
- *Penn Treebank is a popular treebank for English (Wall Street Journal section)*

```
( (S
    (NP-SBJ
      (NP (NNP Pierre) (NNP Vinken) )
      (, ,)
      (ADJP
        (NP (CD 61) (NNS years) )
        (JJ old) )
      (, ,) )

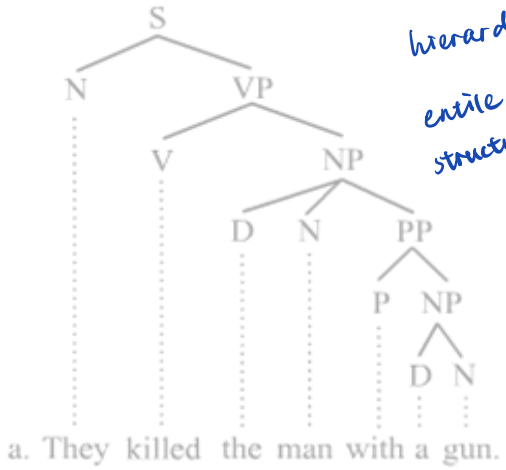
    (. .) ))
```

1 Linguistic Structure

Two main views of linguistic structure

Constituency Parsing



hierarchical

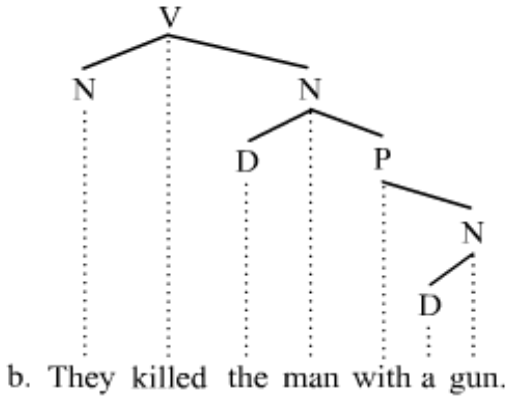
entire sentence structure & relations

Constituency grammars

One-to-one-or-more correspondence. For every word in a sentence, there is at least one node in the syntactic structure that corresponds to that word.

Dependency Parsing

semantic meaning



Dependency grammars

one-to-one relation; for every word in the sentence, there is exactly one node in the syntactic structure that corresponds to that word

0 LECTURE PLAN

THE UNIVERSITY OF SYDNEY

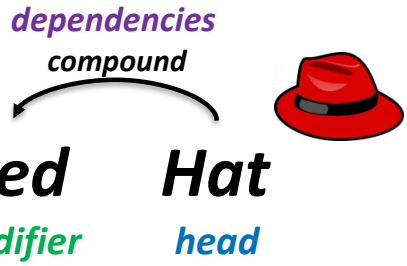
Lecture 7: Parsing

1. Linguistic Structure
2. **Dependency Structure**
3. Dependency Parsing Algorithms
4. Transition-based Dependency Parsing
5. Deep Learning-based Dependency Parsing

Dependency Structure

Dependency Structure

Syntactic structure**: lexical items linked by binary asymmetrical relations ("arrows") called **dependencies



what type of hat

head to modifier
parent
child

modify the meaning of head

use Red to describe hat

Red – **modifier**, dependent, child, subordinate

Hat - **head**, governor, parent, regent

Compound – **dependency relations** (e.g. subject, prepositional object, etc)

**Head* determines the syntactic/semantic category of the construct*

The arrows are commonly typed with the name of **grammatical relations*

Dependency Structure

Dependency Parsing

Represents Lexical/syntactic dependencies between words

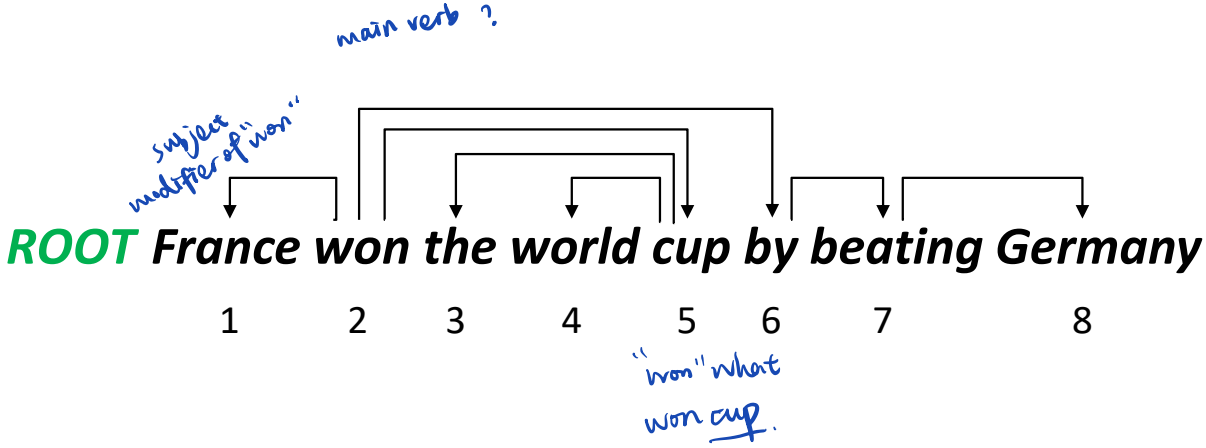
- A sentence is parsed by choosing for each word what other word (including ROOT) is it a dependent of

Dependencies form a tree (connected, acyclic, single-head)

- ***How to make the dependencies a tree - Constraints***

  Only one word is a dependent of ROOT (**the main predicate of a sentence**)

  - Don't want cycles A → B, B → A



Dependency Structure

Dependency Grammar/Parsing History

Panini's grammar (4th century BCE)
The notion of dependencies between grammatical units

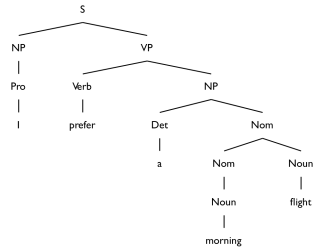
Ibn Maḍā' (12th century)
The first grammarian to use the term dependency in the grammatical sense

Sámuel Brassai, Franz Kern, Heimann Hariton Tiktin (1800 - 1930)
The dependency seems to have coexisted side by side with that of phrase structure

Lucien Tesnière (1959)
Was dominant approach in "East" in 20th Century (Russia, China, …)
Good for free-er word order languages

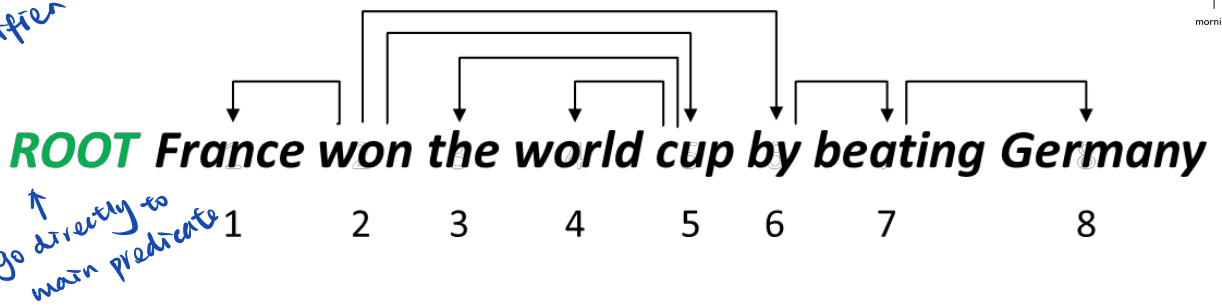
David Hays (1962)
The great development surrounding dependency-based theories has come from computational linguistics

2 Dependency Structure



Dependency Grammar/Parsing

head → modifier



Some people draw the arrows one way; some the other way!

- *Tesnière had them point from head to dependent..*

Usually add a fake ROOT so every word is a dependent of precisely 1 other node

Projectivity vs Non-Projectivity

- There are no crossing dependency arcs when the words are laid out in their linear order, with all arcs above the words
- Dependencies parallel to a CFG tree must be projective
  - Forming dependencies by taking 1 child of each category as head
- But dependency theory normally does allow non-projective structures to account for displaced constituents

Dependency Structure

Dependency Grammar/Parsing

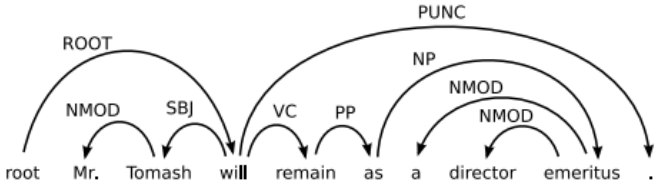


Figure 1: A projective dependency graph.

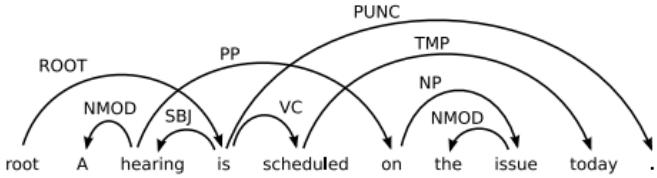

Figure 2: Non-projective dependency graph.

Projectivity vs Non-Projectivity

- There are no crossing dependency arcs when the words are laid out in their linear order, with all arcs above the words
- Dependencies parallel to a CFG tree must be projective
  - Forming dependencies by taking 1 child of each category as head
- But dependency theory normally does allow non-projective structures to account for displaced constituents

Dependency Structure

Dependency Relations

- *The following list shows the 37 universal **syntactic relations** used in Universal Dependencies v2.*

- acl: clausal modifier of noun (adjectival clause)
- advcl: adverbial clause modifier
- advmod: adverbial modifier
- amod: adjectival modifier
- appos: appositional modifier
- aux: auxiliary
- case: case marking
- cc: coordinating conjunction
- ccomp: clausal complement
- clf: classifier
- compound: compound
- conj: conjunct
- cop: copula
- csubj: clausal subject
- dep: unspecified dependency
- det: determiner
- discourse: discourse element
- dislocated: dislocated elements
- expl: expletive
- fixed: fixed multiword expression
- flat: flat multiword expression
- goeswith: goes with
- iobj: indirect object
- list: list
- mark: marker
- nmod: nominal modifier
- nsubj: nominal subject
- nummod: numeric modifier
- obj: object
- obl: oblique nominal
- orphan: orphan
- parataxis: parataxis
- punct: punctuation
- reparandum: overridden disfluency
- root: root
- vocative: vocative
- xcomp: open clausal complement

Universal Dependency Relations: *http://universaldependencies.org/u/dep/index.html*

Dependency Structure

Dependency Relations with annotations

- The idea of dependency structure goes back a long way
- *[Universal Dependencies: http://universaldependencies.org/ ;*
- *cf. Marcus et al. 1993, The Penn Treebank, Computational Linguistics]*

- Starting off, building a treebank seems a lot slower and less useful than building a grammar

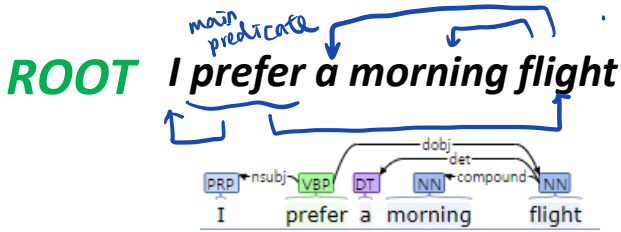
- But a treebank gives us many things
  - Reusability of the labor
    - Many parsers, part-of-speech taggers, etc. can be built on it
    - Valuable resource for linguistics
  - Broad coverage, not just a few intuitions
  - Frequencies and distributional information
  - A way to evaluate systems

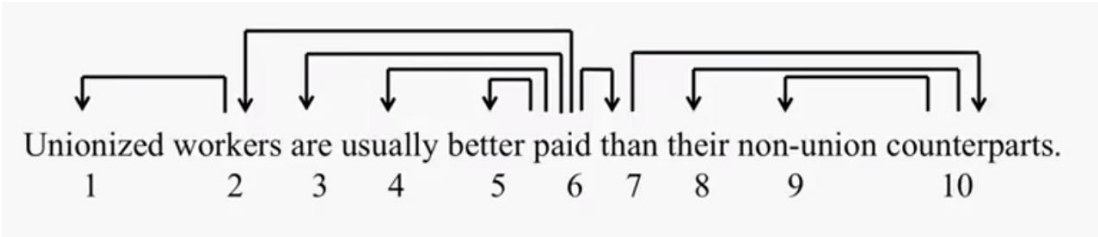
2 Dependency Structure

Dependency Parsing

Exercise – Let's do it together!

- Simpler to parse than context-free grammars





0 LECTURE PLAN

THE UNIVERSITY OF SYDNEY

Lecture 7: Parsing

1. Linguistic Structure
2. Dependency Structure
3. **Dependency Parsing Algorithms**
4. Transition-based Dependency Parsing
5. Deep Learning-based Dependency Parsing

Dependency Parsing Approaches

Methods of Dependency Parsing

- Dynamic programming
  Extension of the CYK algorithm to dependency parsing (Eisner, 1996)

- Constraint Satisfaction (Karlsson, 1990)
  word(pos(x)) = DET → (label(X)=NMOD, word(mod(x))=NN, pos(x) < mod(x))
  A determiner (DET) modifies a noun (NN) on the right with the label NMOD.

- ***Graph-based Dependency Parsing***
  Create a ***Maximum Spanning Tree*** for a sentence
  McDonald et al.'s (2005) MSTParser scores dependencies independently using an Machine Learning classifier

- ***Transition-based Dependency Parsing (Nivre 2008)***
- ***Neural Dependency Parsing***

CYK: Cocke–Younger–Kasami algorithm

Dependency Parsing Approaches

Graph-based dependency parsers

MST Parser (McDonald et al., 2005)

- **Projectivity**
  - English dependency trees are mostly projective (can be drawn without crossing dependencies)
  - Other languages are not

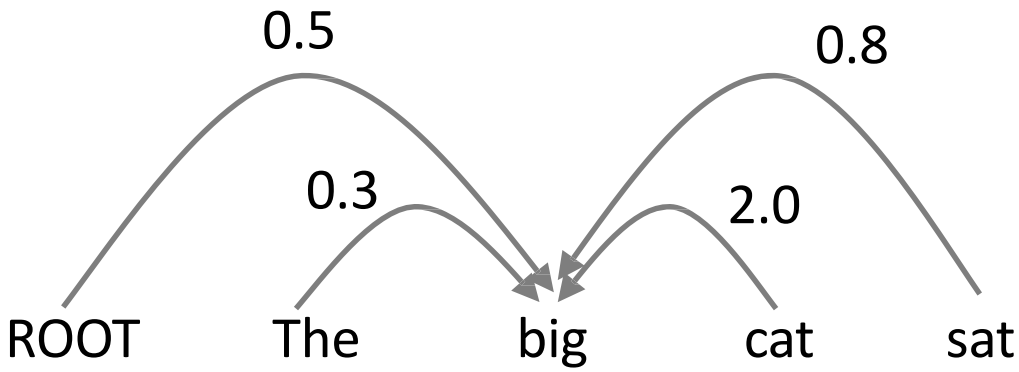
- **Idea**
  - Dependency parsing is equivalent to search for a maximum spanning tree in a directed graph
  - Chu and Liu (1965) and Edmonds (1967) give an efficient algorithm for finding MST for directed graphs

Dependency Parsing Approaches

Graph-based dependency parsers

- Compute a score for every possible dependency for each edge

maximum score

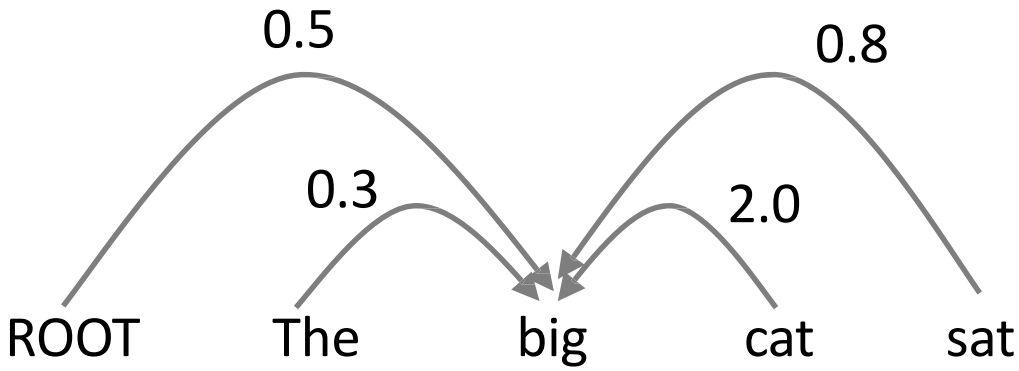


e.g., picking the head for "big"

Dependency Parsing Approaches

Graph-based dependency parsers

- Compute a score for every possible dependency for each edge
  - Then add an edge from each word to its highest-scoring candidate head
  - And repeat the same process for each other word

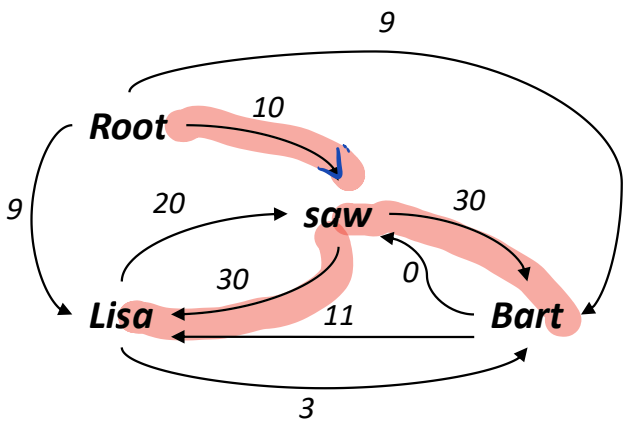


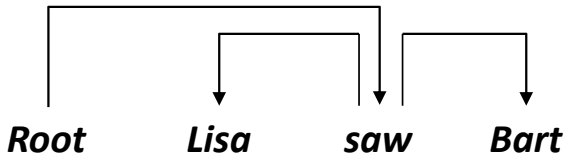
e.g., picking the head for "big"

Dependency Parsing Approaches

Graph-based dependency parsers

- Consider the sentence "Lisa saw Bart"





Dependency Parsing Approaches

Methods of Dependency Parsing

greedy algorithm

Graph-based Dependency Parsing

- Build a complete graph with directed/weighted edges
- Find the highest scoring tree from a complete dependency graph

Transition-based Dependency Parsing

- Build a tree by applying a sequence of transition actions
- Find the highest scoring action sequence that builds a legal tree

0 LECTURE PLAN

THE UNIVERSITY OF SYDNEY

Lecture 7: Parsing

1. Linguistic Structure
2. Dependency Structure
3. Dependency Parsing Algorithms
4. **Transition-based Dependency Parsing**
5. Deep Learning-based Dependency Parsing

Transition-based Parsing

greedy search build one tree

Greedy transition-based parsing (Nivre 2008)

- A simple form of greedy discriminative dependency parser

- **Transition**: an operation that searches for a dependency relation between each pair of words (e.g. Left-Arc, Shift, etc.)
- Design a dumber but really fast algorithm and let the machine learning(deep learning) do the rest.

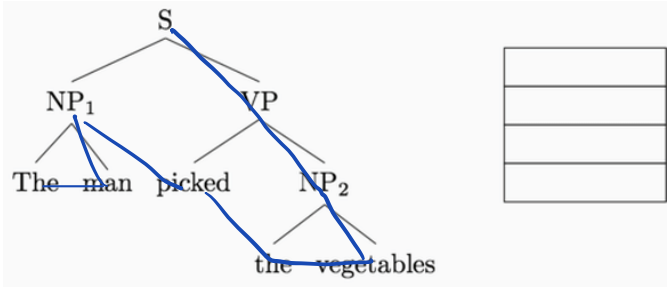
- Eisner's algorithm (Dynamic Programming-based Dependency Parsing) searches over many different dependency trees at the same time.

- A transition-based dependency parser only builds one tree, in one left-to-right sweep over the input

Transition-based Parsing

Transition-based parsing – The arc-standard algorithm

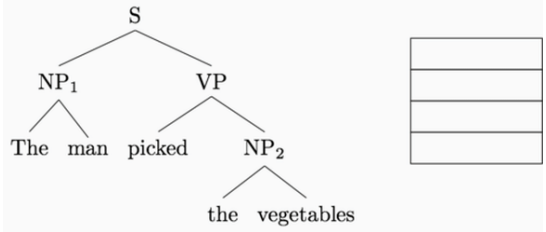
- A sequence of bottom up actions
  - Roughly like “shift” or “reduce” in a shift-reduce parser, but the “reduce” actions are specialized to create dependencies with head on left or right

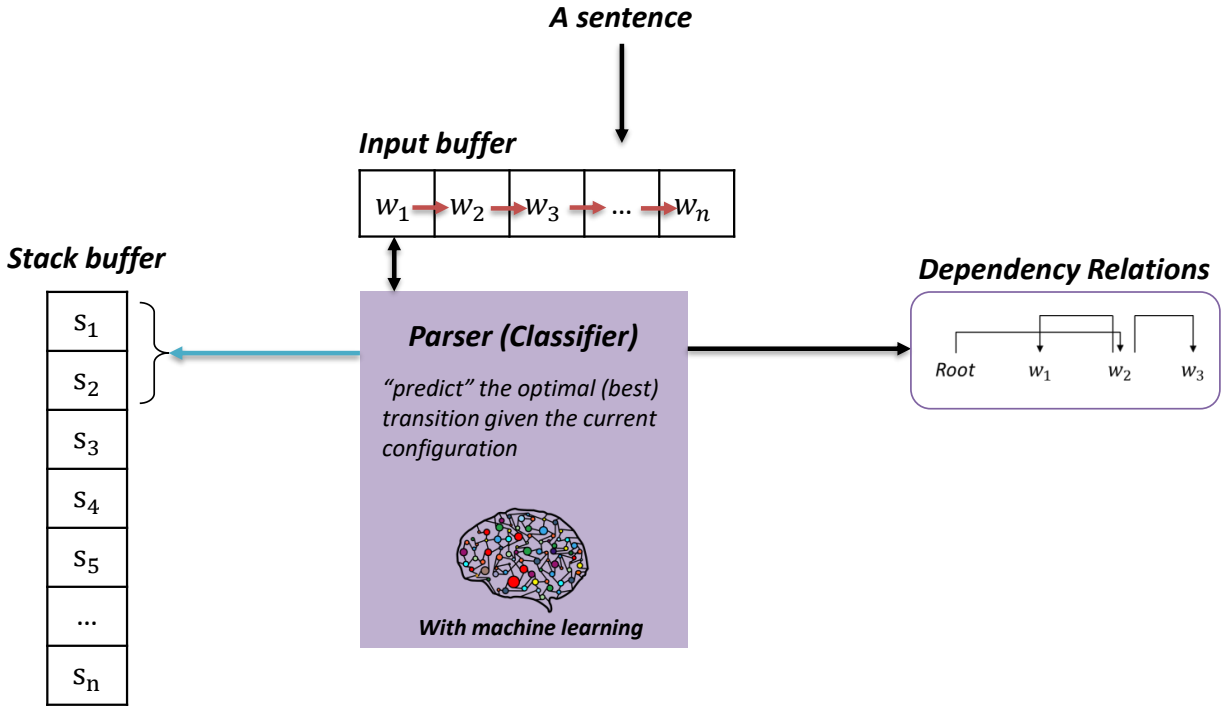


- It is implemented in most practical transition- based dependency parsers, including **MaltParser**. The arc-standard algorithm is a simple algorithm for transition-based dependency parsing.

Transition-based Parsing

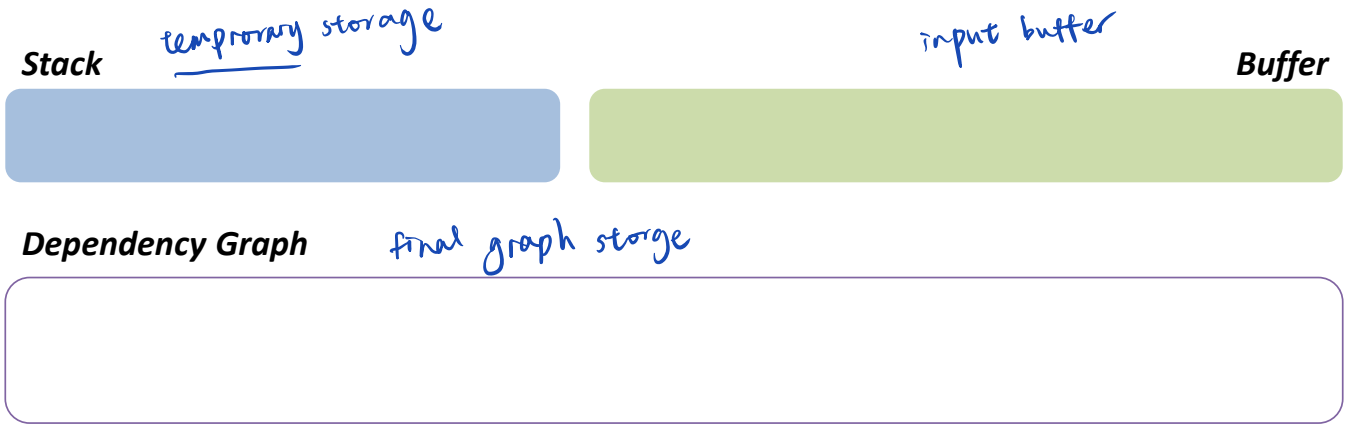
Transition-based parsing





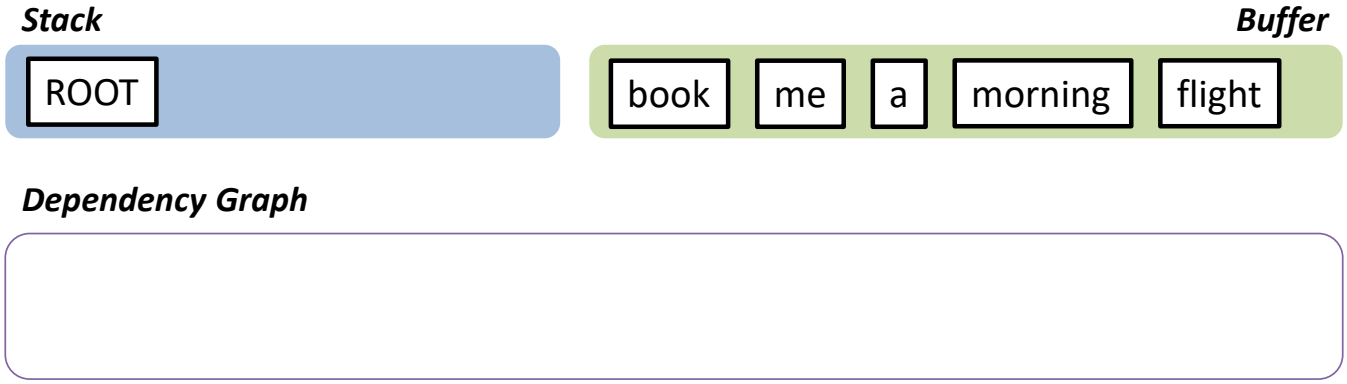
Transition-based Parsing

Transition-based parsing – The arc-standard algorithm



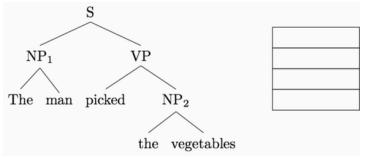
Transition-based Parsing

Transition-based parsing – The arc-standard algorithm



- ***Initial configuration:***
  - All words are in the buffer.
  - The stack is empty or starts with the ROOT symbol
  - The dependency graph is empty.

Transition-based Parsing



Transition-based parsing – The arc-standard algorithm

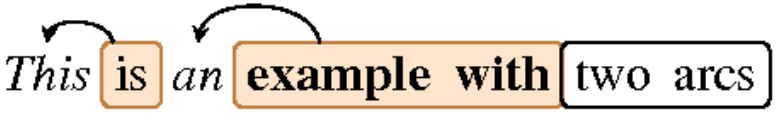
- ***Terminal configuration:***
  - The buffer is empty.
  - The stack contains a single word.

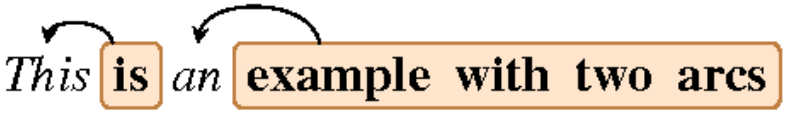
Transition-based Parsing

Transition-based parsing

(a) Arc-standard: *is* and *example* are eligible for arcs.



(b) Arc-eager: *example* and *with* are eligible for arcs.



(c) Easy-first: All unreduced tokens are active (bolded).

Transition-based Parsing

Transition-based parsing – The arc-standard algorithm

Start: $\sigma = [\text{ROOT}], \beta = w_1, \ldots, w_n, A = \emptyset$

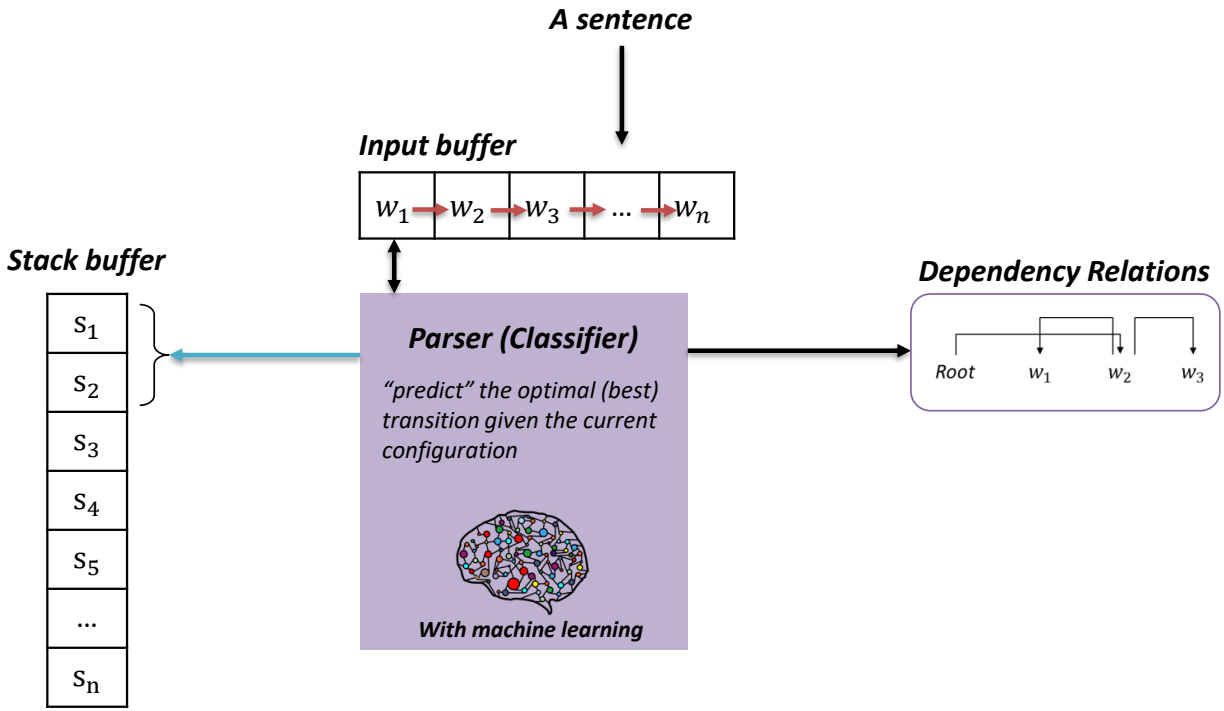
1. Shift $\sigma, w_i|\beta, A \rightarrow \sigma|w_i, \beta, A$
2. Left-Arc$_r$ $\sigma|w_i|w_j, \beta, A \rightarrow \sigma|w_j, \beta, A \cup \{r(w_j, w_i)\}$
3. Right-Arc$_r$ $\sigma|w_i|w_j, \beta, A \rightarrow \sigma|w_i, \beta, A \cup \{r(w_i, w_j)\}$

Finish: $\sigma = [w], \beta = \emptyset$

How to choose the next action?

Transition-based Parsing

Transition-based parsing



Transition-based Parsing

How to choose the next action?

Stand back, You know machine learning!

Goal: Predict the next transition (class), given the current configuration.

- We let the parser run on gold-standard trees.
- Every time there is a choice to make, we simply look into the tree and do 'the right thing'.
- We collect all (configuration, transition) pairs and train a classifier on them.
- When parsing unseen sentences, we use the trained classifier as a guide.

What if the number of pairs is far too large?

Transition-based Parsing

Feature Representation

- Define a set of features of configurations that you consider to be relevant for the task of predicting the next transition.

Example: word forms of the topmost two words on the stack and the next two words in the buffer

- Describe every configuration in terms of a feature vector.

- In practical systems, we have thousands of features and hundreds of transitions.
- There are several machine-learning paradigms that can be used to train a guide for such a task
- Examples: perceptron, decision trees, support-vector machines, memory-based learning

Transition-based Parsing

Evaluation of Dependency Parsing

$$Accuracy = \frac{\#\ correct\ deps}{\#\ of\ deps}$$

Unlabeled attachment score (UAS) = head

Labeled attachment score (LAS) = head and label

5. **Deep Learning-based Dependency Parsing**

Deep Learning-based Parsing

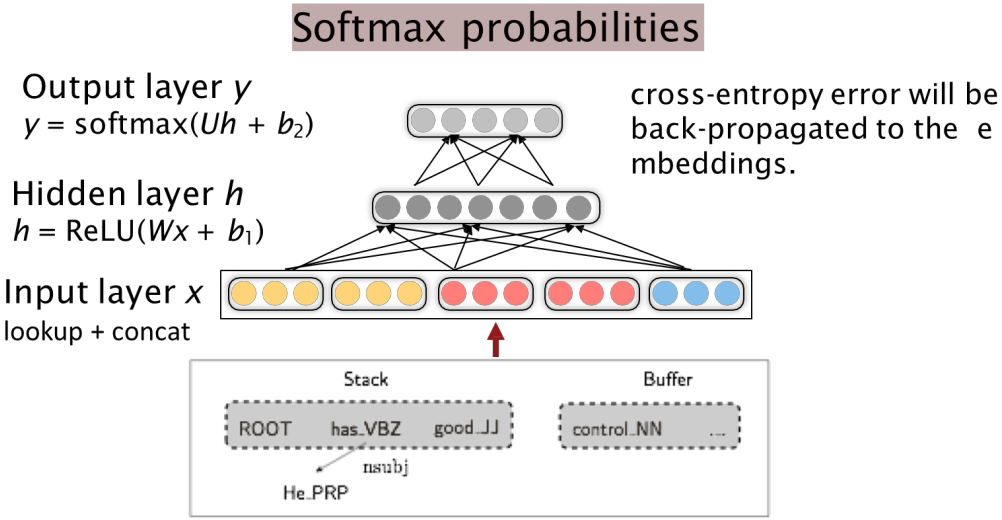
Distributed Representations

- Represent each word as a d-dimensional dense vector (i.e., word embedding)
  - Similar words are expected to have close vectors.
  - NNS (plural noun) should be close to NN (singular noun).

- Meanwhile, part-of-speech tags (POS) and dependency labels are also represented as d-dimensional vectors.
- The smaller discrete sets also exhibit many semantical similarities

Deep Learning-based Parsing

Neural Dependency Parsing (Chen & Manning, 2014)



Deep Learning-based Parsing

Neural Dependency Parsing

Accuracy and parsing speed on PTB + Stanford dependencies.

Parser	Dev		Test		Speed
	UAS	LAS	UAS	LAS	(sent/s)
standard	90.2	87.8	89.4	87.3	26
eager	89.8	87.4	89.6	87.4	34
Malt:sp	89.8	87.2	89.3	86.9	469
Malt:eager	89.6	86.9	89.4	86.8	448
MSTParser	91.4	88.1	90.7	87.6	10
Our parser	**92.0**	**89.7**	**91.8**	**89.6**	**654**

Accuracy and parsing speed on CTB

Parser	Dev		Test		Speed
	UAS	LAS	UAS	LAS	(sent/s)
standard	82.4	80.9	82.7	81.2	72
eager	81.1	79.7	80.3	78.7	80
Malt:sp	82.4	80.5	82.4	80.6	420
Malt:eager	81.2	79.3	80.2	78.4	393
MSTParser	**84.0**	82.1	83.0	81.2	6
Our parser	**84.0**	**82.4**	**83.9**	**82.4**	**936**

Chen, D., & Manning, C. (2014). A fast and accurate dependency parser using neural networks. In Proceedings of the 2014 conference on empirical methods in natural language processing (EMNLP) (pp. 740-750).
